

## Notes On Cantor Set

Cantor Set  $C := \bigcap_{n \in \mathbb{N}} E_n$

- $E_0 = [0, 1]$ .
- each  $E_n$  is disjoint union of intervals each of length  $3^{-n} \forall n \in \mathbb{N}$ .  $E_{n+1}$  is obtained by removing the middle third of each intervals in  $E_n$ .
- $C$  is closed since each  $E_n$  is closed.
- $[0, 1]$  is compact.
- $C \neq \emptyset$  due to the corollary of finite intersection property.
- if  $x$  is an endpoint of any  $E_n$ , then  $x \in C$ .
- $C$  is perfect\*

Remark:  $C$  is compact, perfect, and uncountable non-empty subset of  $\mathbb{R}$  contains no interval, or is of length 0.

(\*) By definition,  $C$  is perfect if  $C$  is closed and  $C' = C$ .

We have  $C' \subset C$  since  $C$  is closed. Consider  $x \in C$  and  $r > 0$ . Pick  $n \in \mathbb{N}$  such that  $3^{-n} < r$ , then let  $I = E_n$  that contains  $x$ . The two endpoints of  $I$  are within radius  $r$  around  $x$  and the two endpoints are in  $C$ . Therefore, at least one of them is not  $x$ , which means  $B_r(x) \setminus \{x\} \cap C \neq \emptyset$ .

Suffice to show any non-empty perfect set is uncountable! (empty set is also a perfect set).

Lemma 1: If  $p_n \in \mathbb{R}^k$ ,  $r_n > 0$  satisfying:

1.  $B_{r_{n+1}}(p_{n+1}) \subset B_{r_n}(p_n)$
2.  $B_{r_n}(p_n) \cap P \neq \emptyset$

Then  $P \cap \left( \bigcap_{n \in \mathbb{N}} \overline{B_{r_n}(p_n)} \right) \neq \emptyset$ .

*Proof.*  $P$  is closed since  $P$  is perfect. Thus,  $P \cap \overline{B_{r_n}(p_n)}$  is compact and non empty. And  $P \cap \overline{B_{r_{n+1}}(p_{n+1})} \subset P \cap \overline{B_{r_n}(p_n)}$ . So by corollary to Theorem 2.36

$$P \cap \left( \bigcap_{n \in \mathbb{N}} \overline{B_{r_n}(p_n)} \right) = \bigcap_{n \in \mathbb{N}} \left( P \cap \overline{B_{r_n}(p_n)} \right) \neq \emptyset.$$

□

Lemma 2: Let  $p \neq x \in R^k$ , and  $r > 0$ . If  $q \in B_r(p) \setminus \{x\}$ , then there is  $s > 0$ , such that  $\overline{B_s(q)} \subset B_r(p) \setminus \{x\}$ . (Exercise!)

**Theorem:** Non-empty Perfect Subset  $P$  In  $R^k$  Is Uncountable.

*Proof.* Consider any  $x_1, x_2, \dots \in P$ . We will inductively choose  $p_n \in P$  and  $r_n > 0$  satisfying:

1.  $x_n \notin \overline{B_{r_{n+1}}(p_{n+1})}$
2.  $B_{r_{n+1}}(p_{n+1}) \subset B_{r_n}(p_n)$

Choose any  $p_1 \in P$  and any  $r_1 > 0$ . Inductively assume that we have chosen  $n$  of them satisfying all the conditions.

Since  $p_n \in P = P'$ , we have that  $B_{r_n}(p_n) \setminus \{p_n\} \cap P$  must be infinite by Theorem 2.20. Pick  $p_{n+1} \in (B_{r_n}(p_n) \cap P) \setminus \{p_n, x_n\}$ .

Choose  $r_{n+1} > 0$  according to lemma 2. Thus we have obtained  $p_{n+1}$  satisfying all the conditions. By lemma 1,  $P \cap \left( \bigcap_{n \in \mathbb{N}} \overline{B_{r_n}(p_n)} \right) \neq \emptyset$ .

By condition 1,  $P \setminus \{x_1, x_2, \dots\}$  contain the above set as a subset.

Hence  $\{x_1, x_2, \dots\}$  is a proper subset of  $P$ . Hence  $P$  is uncountable.  $\square$
